

COSMIC Order Management

– A comprehensive solution you can rely on

With COSMIC Order Management, you can send orders and referrals, receive test results and much more. The module is the link between you and for example the laboratory, and it simplifies and systematises your daily referral work. Here, you can create orders for laboratory tests and imaging investigation.

REFERRALS AND ORDERS TO EVERY SPECIALITY? YES, OF COURSE

Order Management is specially adapted to work within every possible healthcare setting. For lab tests alone you have access to a large number of laboratory specialities such as Clinical Chemistry, Microbiology, Immunology, Blood/Transfusion and Pathology. You can request several tests/studies in a single order. To make it easier for the ordering unit, it is possible to group analyses and create your own studies/analysis packages.

Furthermore, unique medical questions can be linked to every study/analysis to be answered by the requesting doctor (or the person collecting the sample) upon ordering. The laboratory's instructions concerning analyses and the taking of samples can also be displayed as part of the request. A copy function makes it simple to create a serie of orders and of course it is possible to print off labels for specimen pots. For radiological requests, Order Management works by setting up responsible units with various radiological services available e.g USS, CT and MRI.

ANSWERS COME TO THE IN-TRAY - A FOLLOW-UP FUNCTION

The order and referral answers come back and are directed to an in-tray, where nurses and doctors can easily access the results relating to their patients. Within this function it is possible for different care providers with the appropriate access permission to sign that they have been read. The results are stored in list form, one for each specialty. As with an inbox results can be tagged as urgent by both the lab and also the clinician. The clinical values are shown numerically and can be displayed graphically – especially practical when you want to demonstrate how the blood values of a patient have varied during a particular period.

FINELY CALIBRATED AT BOTH ENDS

Order Management is a two-way street, connecting the labs/imaging departments with the clinicians. It also allows those receiving the order to use COSMIC for their own use to relay back information about for example preparation for an examination or the types of sample tubes to be used as well as requesting clinical data such as antibiotic therapy.
